

I would like to submit my comments for approval of in-flight use of the new AirSep portable concentrator. This equipment would not interfere with the plane's equipment, other passengers nor is there a chance of explosion, as it makes o2 from room air, as you well know. It is a small piece of equipment which weighs under 10 lbs. and can fit under the seat. I hope you approve it soon as it would allow more o2 patients to travel without paying additional monies for supplemental o2 onboard the plane, which is \$100 per leg. It can be daunting if unable to schedule a direct flight. Thank you.
